

## CHAPTER OVERVIEW

### 10: Coordination Chemistry II - Bonding

10.1: Evidence for Electronic Structures

10.1.1: Thermodynamic Data

10.1.2: Magnetic Susceptibility

10.1.3: Electronic Spectra

10.1.4: Coordination Number and Molecular Shapes

10.2: Bonding Theories

10.2.1: Crystal Field Theory

10.3: Ligand Field Theory

10.3.1: Ligand Field Theory - Molecular Orbitals for an Octahedral Complex

10.3.2: Orbital Splitting and Electron Spin

10.3.3: Ligand Field Stabilization Energy

10.3.4: Tetrahedral Complexes

10.3.5: Square-Planar Complexes

10.4: Angular Overlap

10.4.1: Sigma Bonding in the Angular Overlap Model

10.4.2: Pi Acceptors in the Angular Overlap Model

10.4.3: Pi Donors in the Angular Overlap Model

10.4.4: The Spectrochemical Series

10.4.5: The Magnitude of Parameters  $\epsilon\sigma$ ,  $\epsilon\pi$  and  $\Delta$

10.4.6: The Magnetochemical Series

10.5: The Jahn-Teller Effect

10.6: Four- and Six-Coordinate Preferences

10.7: Other Shapes

10.P: Problems
